Introduction	248	Impressions	249	Postinsertion care	253
Definition and types	248	Jaw relation records	251	Interim immediate dentures	253
Advantages and disadvantages	248	Teeth selection and posterior teeth arrangement	251	Advantages	253
Indications	249	Try-in	251	Procedure	253
Contraindications	249	Arranging the anterior teeth	251	Comparison of conventional and interim immediate dentures	255
Conventional immediate denture	249	Waxing and processing the denture	252	Summary	255
Diagnosis and treatment planning	249	Insertion of dentures	252		

## INTRODUCTION

Patients who have extracted all of their natural teeth

ridges are well healed. Following extraction of anterior teeth an immediate denture is provided, which only needs to be relined after the healing period.

Home Trails Chapter17.indd.pdf

100%

- Eccentric records as applicable are also obtained to adjust the condylar guidance on an articulator.

**Teeth Selection and Posterior Teeth Arrangement**

- The teeth are selected using the existing teeth as guide for size and shape. Acrylic resin denture teeth are indicated as they are easier to trim and adjust.
- If the patient desires to have his anterior teeth in the original position, alternate teeth are cut away on the cast and the labial portion of each root is excavated to a depth of 1-2 mm on the labial side and flush with the gingival margin of the lingual or palatal side. The selected teeth are placed in their specific positions and modified. By removing only one tooth at a time, the dentist can position the teeth in its original position.
