No. of participants: 16

INTRODUCTION

- Dentin is a complex hard tissue that comprises the bulk of the tooth and covers the dental pulp.¹ Microtubules filled with dentinal fluid, odontoblastic process, mineralised intertubular dentin and highly mineralized peritubular dentin constitute the microstructure of dentin.
- With ageing, the thickness of the peritubular linings increase and reduction in the tubule lumen diameter begins. These changes appear to continue at a constant rate until the lumens have been completely occluded.
- Once the majority of the tubule lumens are mineralized and translucent, sclerotic tissue becomes visible.^{4,5} Besides the microstructural alterations, changes in mechanical properties, such as flexural strength (FS) and microhardness (MH), are also reported in literature for aged dentin.
