Recording

- The three drugs most frequently implicated are phenytoin, calcium channel blockers such as nifedipine amlodipine, and verapamil and immune-suppressant, cyclosporine. Gingival overgrowth is a well-known and established side effect of phenytoin. Other drugs for example sodium valproate and erythromycin.
- Prevalence, phenytoin, cyclosporine and calcium channel blockers account for 50%, 30% and 10-20% of drug induced gingival overgrowth,
- Risk factors: Age (children and teenagers) demographic variables, drug variables, periodontal variables, genetic factors and concomitant medication.
- Small introduction of phenytoin was given and its uses as antiepileptic drug.
- Author has reviewed the mechanism of phenytoin induced gingival overgrowth in this article.
- A literature search of the PubMed/ Embase/ Web of science/ Cochrane central database was conducted to identify the mechanisms involved in the process of phenytoin-induced gingival overgrowth with no time or language restriction.
