DEFINITION:

- ❖ The joint formed b/w atlas and axis in the upper part of the neck.
- ❖ Synovial in nature.
- ❖ Atlanto-axial joint is of complicated nature and consist of three distinct joints;
 - One is found between the dens of the axis and the anterior arch of the atlas.
 - Two are located between the lateral masses of the 1st cervical vertebra and the superior articular facets of the 2nd cervical vertebra.

Anterior View

LIGAMENTS

The following four ligaments stabilize these joints:

- ❖ **Apical ligament:** Connects the dens to the foramen magnum of the occipital bone.
- ❖ **Alar ligaments:** Connect the dens to the lateral margins of the foramen magnum.
- ❖ **Cruciate ligament:** Attaches the dens to the anterior arch of the atlas and the body of the axis to the foramen magnum of the occipital bone.
- ❖ **Tectorial membrane:** Starts at the skull and becomes the posterior longitudinal ligament.

Talking:

ATLAS AND AXIS ANATOMY:

- The **atlas** is the topmost vertebra and chief peculiarity of atlas is that it has no body, it is ring like and consist of anterior and posterior arch and two lateral masses.
- **Axis**, the 2nd cervical vertebra has a concave under side and convex from side to side. The most distinctive characteristic of this bone is strong odontoid process, the dens.

CLINICAL ASPECTS

- Headaches can arise from many different sources including dysfunctional muscles, tears in the ligaments, misalignment of the vertebral bodies, injury to cervical facets and degenerative discs.
- The joint between the two structures is susceptible to traumatic injury and degeneration.
- Excessive flexion could rupture the supraapinous ligament.
- Posterior atlanto-occipital membrane ossification cause migraine headaches due to compression of artery.

1

DEEP CERVICAL FASCIA

(Dr. Indumathi BDS, MSc, FRCR)

2

- Superficial fascia of neck is thin & has no specific features
- On anterolateral aspects - platysma muscle
- Extensive blood vessels, nerves & lymphatic vessels

3

Introduction

- In neck, all muscles, blood vessels & nerves are enclosed by connective tissue - condensed to form recognizable sheaths
- These sheaths are collectively referred as deep cervical fascia
- Characterized by a well-defined capsule
- Conventionally, divided into:

Investing layer
Pretracheal layer
Prevertebral layer

4

Investing layer- horizontal disposition

5

Investing layer- horizontal disposition

- Also called as external layer of deep cervical fascia
- From ant. attachment, splits to enclose trachea
- Has a single layer & forms roof of posterior triangle

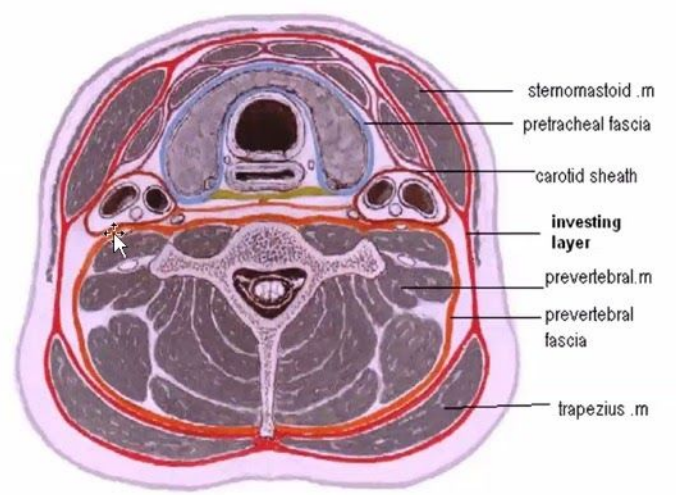

6

Investing layer- horizontal disposition

Investing layer- horizontal disposition

Fascial Layers of Neck Cross Section

Labels on the right side of the diagram:

- sternomastoid .m
- pretracheal fascia
- carotid sheath
- investing layer**
- prevertebral .m
- prevertebral fascia
- trapezius .m

29 Clinical correlation

30 Prevertebral fascia

31 Prevertebral fascia

- Anteriorly to prevertebral fascia
- Extending from C1 to C7
- Contains: trachea, esophagus, thyroid gland, parathyroid glands, vagus nerve, subclavian vessels, brachiocephalic vessels

32

- Forms posterior layer of carotid sheath
- Covers the subclavicular fossa & merges with fascia deep to trapezius
- Above part forms the fascial carpet covering the floor of the posterior triangle.

33

- The prevertebral fascia starts from the hyoid bone & extends to the T1 level
- Passes deep to: trachea, esophagus, thyroid gland, parathyroid glands, vagus nerve, subclavian vessels, brachiocephalic vessels
- Forms floor of posterior triangle
- Contains the transverse process of cervical vertebrae

15 

16 

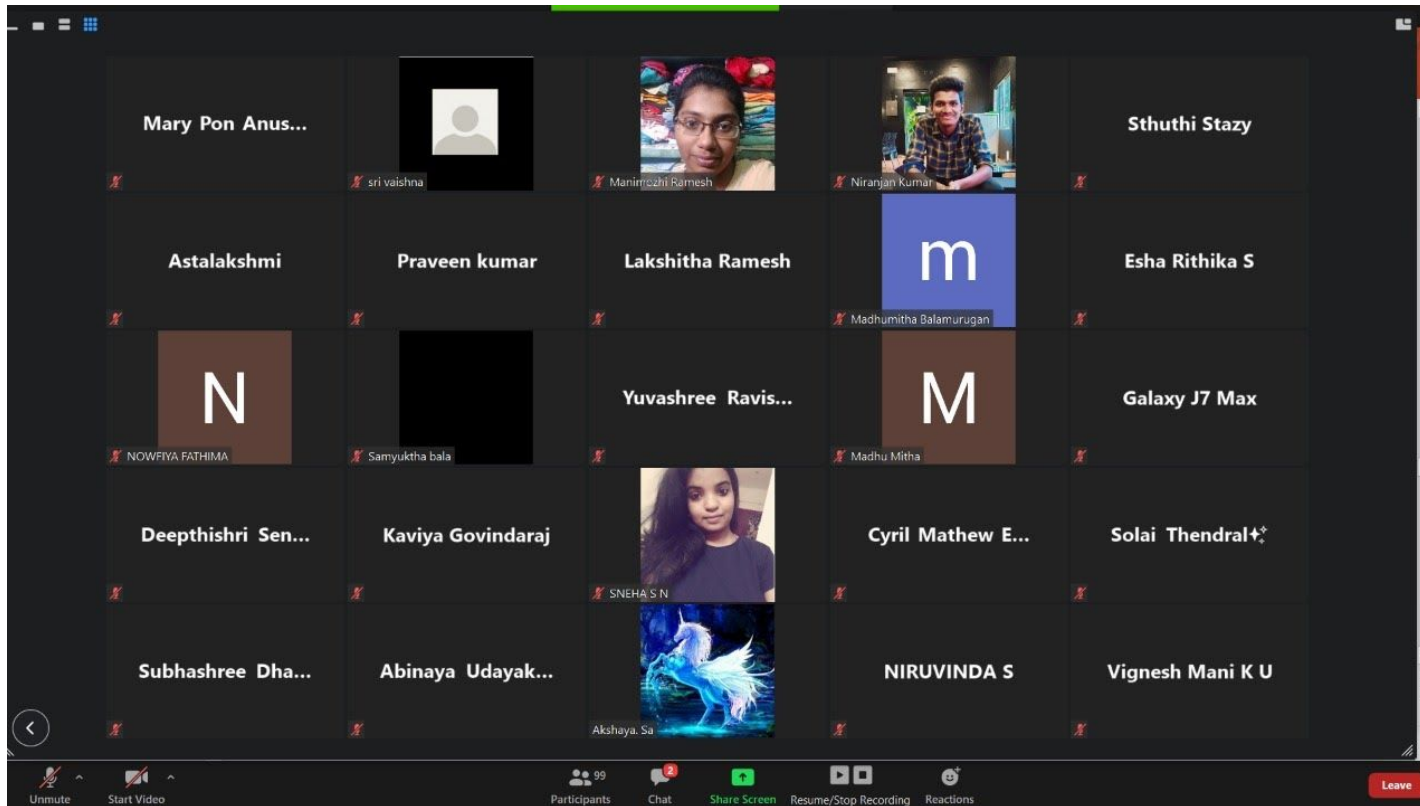

17 

- Posterior to submandibular gland interval between mandible & mastoid process the fascia again splits to enclose the parotid gland
- Superficial layer: Strong & is attached to zygomatic arch, is thick & forms **parotid fascia** or **parotido massetric fascia**.
- Deep layer: Passes medial to the gland & is attached to lower border of tympanic plate & styloid process of temporal bone.
