FINAL YEARS E-CLINIC

Topic : Pulpotomy
Date : 26.06.2020
Time : 11: 30 am
Faculty : Dr. Divya
instructor
Faculty : Dr. Daya, Dr. Senthil
attended
Students : Final Years Aug 19-20 –7/7
Batch : Aug F1
Absentee : -
Platform : ZOOM

5.3 Pulpotomy Technique for Primary Teeth

Numerous pulpotomy materials are available to maintain the vitality of the primary radicular pulp aiming to preserve the primary molar in the dental arch. However, there is in essence only one pulpotomy technique prior to medicament placement:

1. Select the tooth to receive the pulp therapy using criteria addressed in Chaps. 3 and 4 of this book. In summary, the tooth should be devoid of spontaneous pain, have no parulis or mobility, and demonstrate no radiographic internal or external root resorption nor furcation radiolucency.
2. Anesthetize using the technique of choice and isolate the tooth preferably with a rubber dam to avoid contamination of the pulp chamber with salivary bacteria (Fig. 5.1).
3. Remove all caries prior to entering the pulp chamber.
4. Once all caries is removed, a #130 carbide bur under copious water spray is used to expose the pulp chamber (Fig. 5.2).
5. Coronal pulp is removed with a round bur on a slow speed handpiece, and hemostasis is achieved by the application of a cotton pellet for no more than 5 min (Fig. 5.3). If hemostasis cannot be achieved, pulpotomy is no longer indicated as the pulp tissue is inflamed and hyperemic. In such condition, an alternative treatment would be needed (pulpotomy or even extraction).
6. Once hemostasis is obtained, the chosen material is placed and the tooth is restored.

Fig. 5.1 Tooth isolated with a rubber dam prior to caries removal

Fig. 5.2 Pulp exposed prior to de-roofing the pulp chamber

Fig. 5.3 Root canal orifice showing vital tissue after hemostasis

PULPOTOMY QUIZ
