- A Complex mixture of substances derived from serum, leukocytes structural cells of the periodontium and oral bacteria.

- It originates from the gingival plexus of blood vessels and flows through the external basement membrane and the junctional epithelium to reach the gingival sulcus.

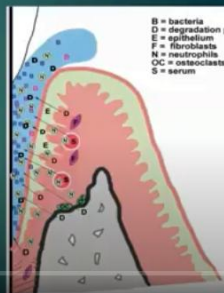

- Represents the transudate of gingival tissue interstitial fluid produced by an osmotic gradient.

- The products of the inflammatory response which occur during the disease process can be found in the GCF

Legend:
B = bacteria
D = degradation products
E = epithelium
F = fibroblasts
N = neutrophils
OC = osteoclasts
S = serum

Developed by Harco electronics

Principle:- The wetness of the paper strip affects the flow of an electronic current

It has 2 metal jaws which acts as the plates of an electrical condenser.

When a dry strip is placed → zero reading is obtained

A wet paper strip will increase the capacitance in proportion to the volume of fluid and this can be measured as an increased value in the readout.

Three models → 600, 6000 and 8000.
