or the vestibule:
extension of a prosthesis by using
or manual manipulation of the
the border areas of an impression

of border moulding is to create a

ing the peripheral tissues

ods of manipulating the peripheral

tissues to mould them.

1. Active method: The patient performs various functions related to the concerned areas to manipulate the borders.

(i) *Labial flange*:
a. *Passive*: The lips are elevated and then extended outwards, downwards and inwards.

After moulding the borders, the tray is removed and compound is chilled in cold water and any excess is trimmed.

This sequence is followed for moulding every section and repeated until the moulding is seen to be accurate without over or under extension:
Soften – place – temper – form – insert – mould – remove – chill – trim.

Maxillary tray border moulding: The moulding can be accomplished using the following sections and sequences (Fig. 4.39):

(i) *Labial flange*:

a. *Passive*: The lips are elevated and then extended outwards, downwards and inwards.

Figure 4.38A Method of softening green stick compound

Figure 4.38B The compound is placed on the border of the custom tray, rotated slightly and then quickly pulled away to prevent long strings from forming

112 SECTION I Complete Dentures

Figure 6.32 **A** The bite fork is mildly warmed on a burner and slowly inserted into the maxillary occlusal rim 3mm above and parallel to the occlusal plane **B** The centre of the fork should coincide with the patient's midline

maxillary rim with the attached bite fork is inserted into the patient's mouth. The parallelism and centring of the attached bite fork is verified (Fig. 6.33).

- The U-frame is supported by two fingers and gently rotated and inserted into the stem of the bite fork in the patient's mouth (Fig. 6.34).
- The condylar rods are unlocked and the condylar heads are then placed in the patient's right and left condylar centres on the previously marked points (Fig. 6.35).
- The third point of reference (infraorbital notch) is palpated and the orbital pointer is set to the third point of reference (Fig. 6.36A,B).
- The condylar rod readings are equalized on both sides and the locking screws are tightened. Following this, the orbital pointer is also tightened in position (Fig. 6.37A,B).
- Once the entire apparatus is in position, the condylar rods, orbital pin and the bite fork are verified for any movement, alignment and parallelism.
- The contoured mandibular occlusal rim may be used during the transfer to stabilize the maxillary rim. The facebow record is removed from the patient by

Introduction	133	Advantages of articulators	133	Articulation	138
Definitions	133	Limitations of articulators	134	Mean value articulator	138
Articulators	133	Requirements	134	Semi-adjustable articulator	140
Functions of articulators	133	Classification	134	Summary	144

INTRODUCTION

As can be inferred from the definitions, an articulator should perform the function of the TMJs of the patient so that the restorations that are developed on it do not interfere with mandibular function during mastication.

Occlusion: The static relationship between the incisive or masticating surfaces of the maxillary or mandibular teeth or tooth analogues (GPT8).
