Honguo Wang, DDS, PhD, and
Qing Yu, DDS, PhD

S

SUCCESS RATE:

- Success rates of intentional replantation ranged from **34% to 95%**. There was a wide range of parameters and a consensus was difficult to obtain. Studies suffered from techniques that are outdated and substandard when compared to modern day methodology. **Most recently, a systematic review of articles from 1966 to 2014 stated a success rate of 88%.**

S

Conclusion

Intentional replantation is a reliable and predictable procedure that may be regarded as a potential option when considering endodontic periradicular surgery.

- Thus when properly performed, Intentional replantation can provide good long-term results for teeth that otherwise would be regarded as hopeless.

The primary goal of any conservative is to preserve natural dentition.

- The intentional replantation for proper case selection could provide long-term results as good as those of apical surgery.
- The intentional replantation might be suggested as an alternative treatment plan for certain cases when routine treatments not applicable, have failed, or periapical surgery unlikely to succeed, impracticable or less acceptable by the patients.
- Although intentional replantation is considered as the procedure of the last resort, however, dental practitioners may still be unfamiliar with the application of such a technique.
