Abstract

Rushton bodies are peculiar, eosinophilic, linear, curved or straight, polycyclic, glassy structures occurring with variable frequency in the epithelial lining of odontogenic cysts, whose presence occasionally contributes to the diagnosis. Presence of these structures depends upon the sectioning plane of specimen. They are easily identifiable by their peculiar morphological and staining patterns. There is considerably ambiguity about the nature and epithelial, vascular, odontogenic or keratinous origin of these hyaline bodies.

This article highlights the occurrence, light and electron microscopic features and Histogenesis of Rushton bodies.

PARTICIPANTS ATTENDANCE

The screenshot shows a mobile application interface for a presentation. At the top, the status bar displays the time 12:04, signal strength, and battery level at 15%. Below the status bar, there is a dark blue header with the text "Close" and "Participants (11)". A search bar with a magnifying glass icon and the word "Search" is positioned below the header. The main content area lists 11 participants, each with a circular profile picture, a name, and a status (e.g., "me, host" for the first participant). To the right of each name is a video camera icon and a microphone icon, with a chevron arrow pointing right. The participants are: Gowri Santhakumar (me, host), Anu Priya, Dr. Harini Priya, Sathish Muthukumar, Sreeja C, Dr Serena, Dr. Prisilla, Krithigaa Sivaraman, Leo Caroline, Merlin Jayaraj, and N NACHIAMMAI. At the bottom of the screen, there are four buttons: "Chats", "Invite", "Mute All", and "Unmute All".
