FACULTY PRESENTATION - DR. MERLIN JAYARAJ

SHARED SCREEN

Recording

MUCOEPIDERMOID CARCINOMA

- is a malignant epithelial tumour composed of varying proportions of mucous secreting cells, epidermoid cells and intermediate cells forming cysts and solid islands.
- WHO – malignant glandular epithelial neoplasm characterized by **mucous, intermediate and epidermoid [Squamous]** cells, with columnar, clear cell and oncocytoid features.
- Principal tumour of radiation related to SG malignancies. seen in survivors of atomic bombing of Hiroshima and Nagasaki and children treated for leukemia with radiotherapy
- Most common malignant salivary gland neoplasm and second highest frequency of occurrence among all salivary gland tumours.
- Most common malignant salivary gland neoplasm in children

INTRODUCTION

- There are about 3,00,000 fungal species out of which only few are infectious to humans.
- They are aspergillosis, candidosis, coccidioidomycosis, cryptococcosis, histoplasmosis, mycetomas, and paracoccidioidomycosis
- A single test cannot give accurate diagnosis whereas a combination of microbiological, histopathological and serological evidence is required
- A good laboratory diagnosis is obtained by adequate clinical sample and selection of appropriate microbiological test
- The fungal species can be demonstrated either directly or isolated in culture techniques

6

INTRODUCTION

- Lack of success in chemotherapy, radiotherapy and surgery lead to immunotherapy.
- Full recovery of terminal cancer is zero
- Many forms of immunotherapy that ranges from,
 1. Check point therapy
 2. Cancer vaccines
 3. Oncolytic viruses

14 T cell types and their characteristics

15 BACKGROUND OF CAR T CELL THERAPY

16 COMPOSITION OF CAR T CELL

CART cell therapy

- The composition of the CAR T cell depends upon the generation of the CAR T cell
- The targets of CAR T cells are the epitopes on only the cancer cells
- CD19 which is a cancer biomarker is not generally recognized by the T Cells.
- CD 19 is produced by both the malignant B cells as well the normal lymphocytes.

CONCLUSION

- However, it might be time for a more serious evaluation of ways to gain a theoretic al mastery of the immu ne system which could potentially free CAR T cell therapies from adverse events in the future.
- CAR T cell therapy has a place as a promis ing form of immunoth erapy and the pote ntial for sign ificant improvements in patient outc omes, particularly patients wi th cancer.

The image displays a histological slide of skin tissue, likely a biopsy specimen, stained with hematoxylin and eosin (H&E). The slide shows a cross-section of the epidermis and underlying dermis. The epidermis is characterized by a thickened stratum corneum (hyperkeratosis) and the presence of atypical keratinocytes, which are cells that exhibit abnormal morphology and arrangement, suggesting a pre-malignant or malignant condition. The dermis shows a dense, fibrous connective tissue structure. The slide is presented within a video conference interface, with a 'Recording' indicator in the top left corner. On the right side, there is a vertical stack of participant video feeds. The top feed shows Merlin Jayaraj, followed by beeula A (Dr. Beeula), Sathish Muthukumar, N NACHIAMMAI, and Gouri Sankar. A 'Swap shared screen with video' button is visible above the top feed.

The image shows a histological slide of oral tissue, likely from a biopsy. The slide is stained with hematoxylin and eosin (H&E), showing a pinkish-purple hue. The tissue structure includes a thick layer of compact orthokeratosis at the surface, followed by a granular zone. Below this, there are typical keratinocytes and a dilated venule. The slide is being presented in a video conference window, with a sidebar on the right showing the faces of the participants: Merlin Jayaraj, beeula A, Sathish Muthukumar, N NACHIAMMAI, and Gowri Senthil. A 'Recording' indicator is visible in the top left corner of the video window.

RT -PCR

The diagram illustrates the RT-PCR process in four steps:

1. Incubate with reverse transcriptase to synthesize cDNA strand. mRNA (5' to 3') and an Oligo(dT) primer (3' to 5') are shown. The reverse transcriptase synthesizes a cDNA strand.
2. When cDNA strand is completed, hydrolyze RNA strand. The resulting cDNA strand is shown.
3. Incubate with DNA polymerase to synthesize second DNA strand. A double-stranded cDNA (ds-cDNA) is formed.
4. Incubate with terminal transferase to add single-stranded tails. The ds-cDNA is ready for insertion into an appropriate cloning vector.

Small text at the bottom left: Molecular Biology Laboratory, Inc.

The diagram illustrates the TaqMan probe amplification assay:

- Forward PCR primer (3' to 5') and Reverse PCR primer (5' to 3') are shown.
- A TaqMan probe is shown with a Fluorophore (yellow circle) and a Quencher (black circle).
- The process involves Polymerization and Amplification Assay.
- Fluorescence is observed during Probe displacement and cleavage.
- The result shows PCR Products and Cleavage Products.

Small text at the bottom left: PCR Products, Cleavage Products

The infographic is divided into two main sections. The left section explains the science of soap and virus interaction, while the right section provides a step-by-step guide for handwashing.

THE CORONAVIRUS has a membrane of oily lipid molecules, which is studded with proteins that help the virus infect cells.

SOAP MOLECULES have a hybrid structure, with a head that bonds to water and a tail that avoids it.

SOAP DESTROYS THE VIRUS when the water-shunning base of the soap molecules wedge themselves into the lipid membrane and pry it apart.

SOAP TRAPS DIRT and fragments of the destroyed virus into bubbles called micelles, which wash away in water.

Handwashing Steps:

- Wet hands under running water
- Apply soap and rub palms together to ensure complete coverage
- Spread the lather over the backs of the hands
- Make sure the soap gets in between the fingers
- Grip the fingers on each hand
- Pay particular attention to the thumbs
- Press fingertips into the palm of each hand
- Dry thoroughly with a clean towel

RECORD OF e CLASS

PLATFORM	 https://us04web.zoom.us/j/942442047
SESSION	MALIGNANT SALIVARY GLAND NEOPLASM – POLYMORPHOUS LOW-GRADE ADENOCARCINOMA & CARCINOMA EX PLEOMORPHIC ADENOMA
PRESENTING FACULTY	DR. MERLIN JAYARAJ
DATE	11.04.2020
TIMING	08.30 am to 10.30 am
PG PARTICIPANTS	Dr. Gowri, Dr. Krithigaa, Dr. Anupriya, Dr. Leo Caroline, Dr. Priscilla – 5 participants
FACULTY ATTENDED	Dr. R. Sathish Muthukumar

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

The screenshot shows a Zoom meeting interface with a presentation slide. The top of the screen displays a row of participant video feeds: Bavadharini, Merlin Jayaraj, Gokul S, Sathish Muthu, and Srinivas N. Below the feeds is the Zoom toolbar. The main area shows a presentation slide from Microsoft PowerPoint. The slide title is 'MALIGNANT SALIVARY GLAND NEOPLASMS - 3'. The presenter is Dr. Merlin Jayaraj MDS, Senior Lecturer, Department of Oral & Maxillofacial Pathology. The date is 11.04.2020. The slide also features the Chettinad Dental College & Research Institute logo and a thumbnail gallery on the left side.

**POLYMORPHOUS LOW GRADE
ADENOCARCINOMA**

The image shows a Zoom meeting interface. At the top, there is a row of participant thumbnails. From left to right, the participants are: Bavadharini ..., Merlin Jayaraj (who is the active speaker), Gokul S, Sathish Muthuku..., and Srinivas N. To the right of these thumbnails is a blue circular button with a white arrow pointing right. Below the thumbnails, there is a small red circle icon and the text "Recording...". The main part of the screen is a large white rectangle displaying the title "POLYMORPHOUS LOW GRADE ADENOCARCINOMA" in bold black capital letters. A thin red horizontal line is positioned below the title.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

POLYMORPHOUS LOW GRADE ADENOCARCINOMA

- In areas, usually at the periphery of the tumor, there are cells aligned in single files – SINGLE FILE PATTERN/INDIAN FILE PATTERN

At the tumor periphery, the cells are arranged in a linear, single cell pattern resembling "indian file" or beads on a string pattern of infiltration (H&E stain, $\times 100$)

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

CARCINOMA EX PLEOMORPHIC ADENOMA

DIFFERENTIAL DIAGNOSIS

- A Ca ex PA can be mistaken for a benign PA.
- It can also be misdiagnosed as other benign and malignant salivary gland tumours.
- Metastatic mixed tumour is less common than Ca ex PA and is differentiated from Ca ex PA by having no carcinomatous component.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

The image shows a Zoom meeting interface. At the top, there is a row of five participant video thumbnails with their names below them: Bavadharini Selv..., Gayathri S A, Merlin Jayaraj, Aateef Ahmed, and Swetha nidhi. Below the thumbnails is a status bar with icons for mute, video, and a 'Recording...' indicator. The main area of the screen is a shared presentation slide. The slide has a light gray background and features the title 'CARCINOMA EX PLEOMORPHIC ADENOMA' in bold, black, uppercase letters. A horizontal pink line is positioned below the title. Underneath the line is a clinical photograph of a patient's face, showing a large, rounded, reddish-pink mass on the lower cheek and jaw area. The bottom of the Zoom window shows a wooden floor texture.

SHARED SCREEN

Recording...

CARCINOMA EX PLEOMORPHIC ADENOMA

PROGNOSIS

- Patients with non-invasive or minimally invasive Ca ex PA have better prognosis than patients with invasive Ca ex PA.
- Tumour size and grade are also noted to be significant prognostic indicator in invasive Ca ex PAs.
- Patients with high grade carcinomatous components have poor prognosis when compared to patients with low grade carcinomatous components .
- The prognosis of Ca ex PA also depends on pathological staging parameters like the level of invasion, lymph node involvement, and local or distant metastasis.
- Clinically, the prognosis of the cancer also depends on the completeness of the tumour resection.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

The image shows a Zoom meeting interface. At the top, there is a video gallery with five participants: Bavadharini Sel..., Merlin Jayaraj, beeula A, Afridi hame..., Swetha nidhi, and Gayathri S A. Below the gallery, the main screen displays a presentation slide titled "ACINIC CELL CARCINOMA". The slide has a pink header bar with the word "DEFINITION" in white. The content of the slide is as follows:

- According to the WHO, acinic cell carcinoma (ACC) is a malignant epithelial neoplasm of the salivary glands in which at least some of the neoplastic cells demonstrate serous acinar cell differentiation characterized by cytoplasmic zymogen secretory granules.
- Salivary ductal cells can also be a component of this low-grade neoplasm that most often occurs in the parotid gland and presents at a relatively younger age than other salivary gland tumors.

There are yellow handwritten lines at the bottom of the slide.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

Recording...

ACINIC CELL CARCINOMA

CAUSES

- Possible causes of ACC include
 - ❖ previous radiation exposure
 - ❖ familial predisposition.

OTHERS- ENDOGENOUS HORMONES

- Estrogen receptors is reported in a minority of cases of ACC
- Progesterone receptors and androgen receptors are also seen in some cases of ACC.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

Recording...

ACINIC CELL CARCINOMA

RECURRENCE AND METASTASIS

- ACC has a significant tendency to recur, to produce metastases, and may have an aggressive evolution.
- The average recurrence rate is estimated to be around 35%.
- Late local recurrence is reported in many cases, up to 30 years from the initial presentation.
- Metastases tend to be hematogenous rather than lymphatic, with a propensity for lung and bone.
- Distant spread occurs in 12% of all patients during the course of ACC.
- Most common sites are cervical lymph nodes (16% of ACC patients) and the lungs. Other reported sites include the cavernous sinus, spine, sternum, orbit, and the liver and skin. Moreover, intracranial extension of parotid ACC can be seen.

FACULTY: DR. MERLIN JAYARAJ PRESENTATION

SHARED SCREEN

The image shows a Zoom meeting interface. At the top, there is a row of participant video thumbnails with names: Rohithchandr..., Sriram Mahe..., Ishwerya M..., Srivishnu Jan..., Gayathri Na..., and Soofiya Shobi... Below the thumbnails, a status bar indicates 'Recording...' and 'Remaining Meeting Time: 08:46 | Upgrade to Pro'. The main screen displays a presentation slide titled 'ACINIC CELL CARCINOMA'. The slide features a histological image of a tissue section. A black arrow points to a cluster of cells, and a red line is drawn across the slide. Below the image, there is a caption: 'Figure 1. Acinic cell carcinoma, which is encapsulated (arrow), and consists of clusters of malignant cells forming acini (left). The malignant cells themselves are pleomorphic and have atypical nuclei (hematoxylin and eosin, 40x). [Courtesy of Dr. H. B. Terrell]'
